Decoherence and dynamical entropy generation in quantum

Using out-of-equilibrium field theory techniques we show that the Gaussian von Neumann entropy for a pure quantum state increases to the interacting thermal entropy. This quantifies decoherence and thus measures how classical our pure state has become. The decoherence rate is equal to the single particle decay rate in our model.

The entanglement entropy allows to make a precise unification between entanglement of the spin with its environment, decoherence, and quantum phase transitions. Can We Explain Thermodynamics By Quantum Decoherence

Let us consider now the connection between entropy increase and decoherence of open systems. Zurek, Habib and Paz (1993) have shown that the von Neumann entropy $k \text{Tr} \ln$ is a monotonic function of the volume of phase space over which the Wigner function spreads.

Decoherence Information Philosopher

Decoherence is the study of interactions between a quantum system (generally a very small number of microscopic particles like electrons, photons, atoms, molecules, etc. - often just a single particle) and the larger macroscopic environment, which is normally treated "classically," that is, by ignoring quantum effects, but which decoherence theorists study quantum mechanically.

Quantum decoherence Wikipedia

Quantum decoherence is the loss of quantum coherence. In quantum mechanics, particles such as electrons are described by a wave function, a mathematical representation of the quantum state of a system; a probabilistic interpretation of the wave function is used to explain various quantum effects.

Quantum Decoherence and Entanglement Induced by Nonlinear

Information on entanglement between the field and matter is studied by comparing the results for mutual entropy, which is a measure of the total correlation, and the negativity as a measure of the amount of entanglement. It is found that the nonlinearity of the dissipation tends to accelerate the decoherence of the global, field, and atomic states.

Entropy arrow of time Wikipedia

Entropy is the only quantity in the physical sciences (apart from certain rare interactions in particle physics; see below) that requires a particular direction for time, sometimes called an arrow of time. As one goes "forward" in time, the second law of thermodynamics says, the entropy of an isolated system can increase, but not decrease.

Hence, from one perspective, entropy measurement is a

Decoherence doesn't solve the and/or problem. It solves the "independent branches" problem. It shows us why there's no observable quantum interference anymore between different branches once we are coupled to a complex system (like an "environment"). It doesn't show us why only one of these branches is "actually there".
