Simple Matrix A Multivariate Public Key Cryptosystem

In the context of multivariate public key cryptosystems, the MinRank attack can be used to find linear combinations of the public key polynomials of low rank which then correspond to central polynomials. The MinRank attack is therefore applicable to all multivariate schemes whose central polynomials are of low rank.

MULTIVARIATE PUBLIC KEY CRYPTOSYSTEMS FROM DIOPHANTINE

Multivariate public key cryptosystems (MPKC) are one possible alternative to the current public key schemes. The public key of an MPKC is a system of multivariate polynomials, usually quadratic, over a finite field. This idea is based on the fact that solving a multivariate polynomial system over a finite field is an NP-complete problem.

Multivariate cryptography Wikipedia

Multivariate cryptography is the generic term for asymmetric cryptographic primitives based on multivariate polynomials over a finite field. In certain cases those polynomials could be defined over both a ground and an extension field. If the polynomials have the degree two, we talk about multivariate quadratics.

<http://links.assetize.com/Multivariate-cryptography-Wikipedia.pdf>

Homomorphic Encryption from Private Key to Public Key

public-key one. This direction will be addressed by our main result, Theorem 3.1, which shows how to construct a public-key encryption scheme from any private-key scheme that is weakly homomorphic w.r.t addition modulo 2. The resulting public-key scheme partially retains the homomorphic properties of the private-key scheme (see Section 1.2).

<http://links.assetize.com/Homomorphic-Encryption--from-Private-Key-to-Public-Key.pdf>

Identity Based Signature Schemes for Multivariate Public

In this paper, we proposed an idea to construct a general multivariate public key cryptographic (MPKC) scheme based on a user's identity. In our construction, each user is distributed a unique identity by the key distribution center (KDC) and we use this key to generate user's private keys.
