The soil analysis of a home and garden soil test kit is generally not as accurate as a lab test. Buffer pH is performed in a lab and is the measure of the soil s resistance to change. Simplified, soils high in organic matter or clay require more lime to correct acidity problems than sandy soils with the same pH reading.

Soil Lead Contamination Lead is naturally present in all soils. It generally occurs in the range of 15 to 40 parts lead per million parts of soil (ppm), or 15 to 40 milligrams lead per kilogram of soil (mg/kg). Pollution can increase soil lead levels to several thousand ppm. The major cause of soil lead contamination in populated areas is the weathering, chipping, scraping, sanding, and sand
