Diversity of soil cryptostigmatid mites Acari Oribatida

For taxonomic studies of oribatid mites, litter, soil, and humus samples from all possible habitats from the districts of Himachal Pradesh were collected randomly. The samples were collected using a shovel from the upper 10-cm soil profile of diverse habitats such as soil, moss, litter, and decomposed dung from river banks, agricultural fields, grasslands, and fisheries (Table 1).

Oribatid mites of the superfamily Trizetoidea Ewing 1917

Abstract. Two new species of the oribatid mite superfamily Trizetoidea (Acari, Oribatida) are described from Peru. Rhynchoribates (Rhynchoribatodes) rioyuyapichisensis Ermilov, sp. n. differs from the other species of the subgenus by the long flagelliform notogastral setae. Rhynchoppia puertoincaensis Ermilov, sp. n. is morphologically similar to R. capillata (Balogh, 1963), but differs by the

Introduction. *Benoibates* (Acari, Oribatida, Oripodidae) is a genus of oribatid mites that was proposed by Balogh (1958) with *Benoibates flagellifer* Balogh, 1958 as type species. Currently, it includes 12 species, distributed in the Neotropical region (seven species), U.S.A. (two species), Ethiopian region (two species) and Polynesia (one species) (data summarized by Sub as 2004, updated 2014).

Edaphic variables conditioning the habitat of oribatid

The soil is a complex three-dimensional habitat and any changes in its structure and porosity are likely to affect the type and abundance of soil biota. Oribatid mites play an important role in the decomposition and mineralization of soil organic matter and their abundance depends on diverse soil parameters, including soil texture, organic matter content, pH, moisture, and the pore system.

The tropics as ancient cradle of oribatid mite diversity

The tropics therefore might be viewed as "ancient cradle" of oribatid mite diversity. In contrast, cold habitats at high latitude where early-derived oribatid mites flourish might be viewed as "museum" of cold adapted early-derived oribatid mites which appear to have radiated much less than the (younger) tropical lineages.
